Training and Active Social Participation in the Incorporation of Health Technologies in the Brazilian Unified Health System

Morais QCD, Santos M, Costa MG, Spada DM, Barros B, Leite LFDA, Leite BR, Mateus I

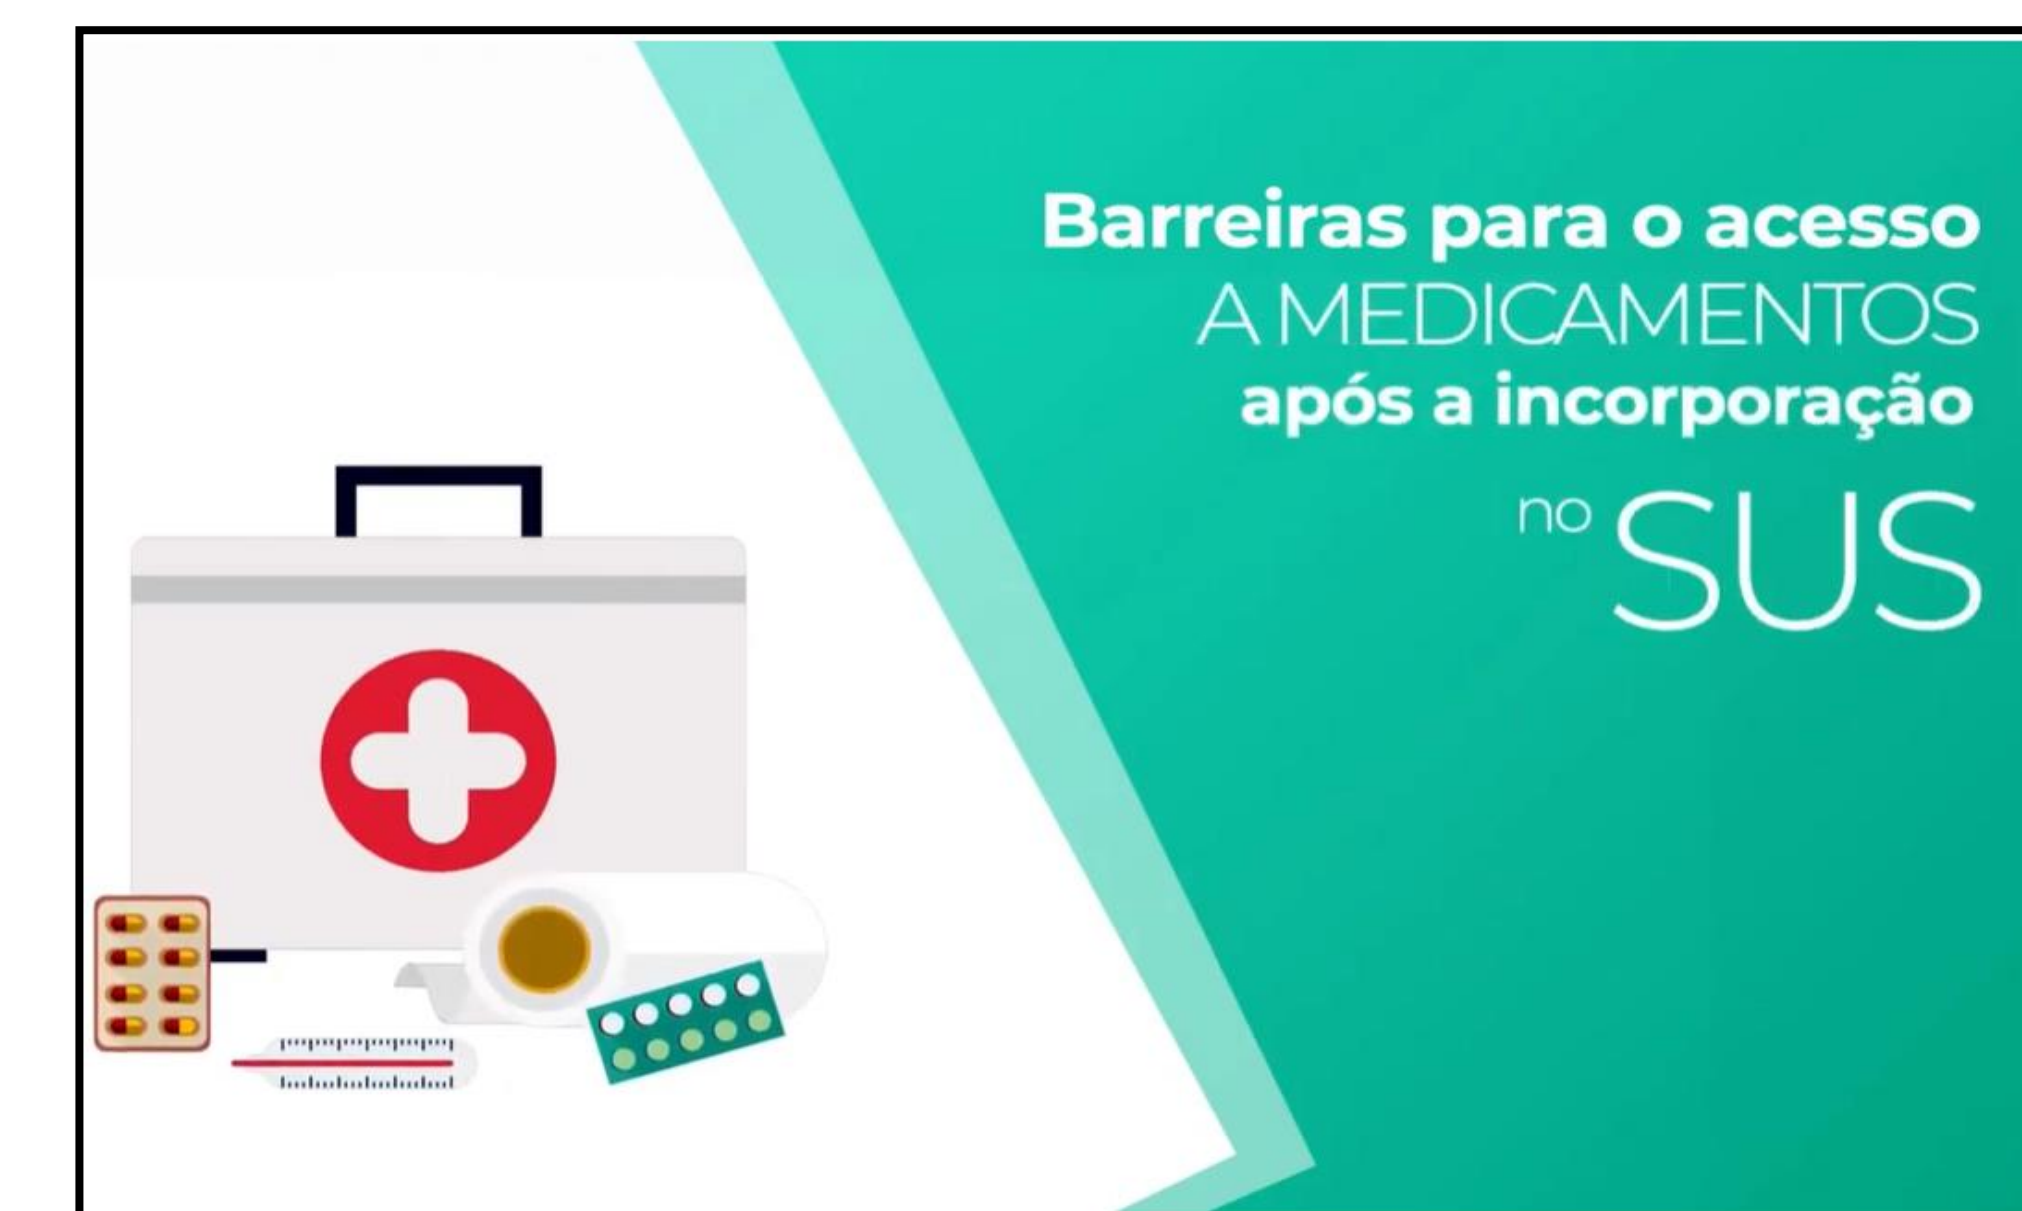

Social participation: public health improvements

Understand the process of incorporation of health technologies in the Brazilian Unified Health System

How to recognize if a scientific research is reliable?

Barriers to access to medicines after incorporation into the Brazilian Unified Health System

Cost threshold is a parameter for understanding the relationship between cost value and health gain generated by a technology in the Brazilian Healthcare System

RESULTS:

- The feedback sent by the participants brought several suggestions, for example, the adoption of accessibility tools for people with visual and auditory disabilities, including racial diversity in movies, and highlighting the importance of using everyday examples to facilitate the understanding of users on the topics addressed. The suggestions for improvement will make the material more user-friendly.

CONCLUSIONS:

- Health training strategies seek to solve users' lack of knowledge about technology incorporation processes in the Brazilian public health system. The user is empowered, and the system is strengthened by health education. It includes social actors in health decisions, privileging the public interest. In a second moment, all videos will be made available on a digital teaching platform to train users with subsequent evaluation through interactive games.
